

sl no	Changes Made	Change Description
1	Jira Issue Fixes	https://jira-librewireless.atlassian.net/browse/SB-320 https://jira-librewireless.atlassian.net/browse/SB-408 https://jira-librewireless.atlassian.net/browse/JH-54
3	Not Implemented / Pending Features	- Global Search - All App Info options except App Preferences
4	New Changes	- Save Playlist Feature in DMP and USB - Stability fixes Airable Music browsing
5	Known Issues	1) TuneIn Podcast: When clicking Next, a “Content Not Available” message is displayed initially, after which the next content starts playing. 2) Deezer Playlist – Stream Quality: Deezer playlists also support stream quality. However, the quality index cannot be passed because the available index parameter is already being used for the playlist index as per the device-side requirement. Therefore, stream quality cannot be controlled in this case, and the device will use the highest available audio quality for playback. 3) Deezer Presets – Favourite Status: In FAV_LIST the artist field is empty for Deezer tracks. Since we currently identify favourites by checking both the track name and artist, the tick icon is not displayed for Deezer presets. This requires a device-side change to handle Deezer favourites correctly. 4) Deezer – Single Track Playback: Single-track playback from Deezer is not working. Currently, playback works only when the track is played from a playlist. 5) Deezer – Previous Internet Radio Podcast Playing on Next: If we first play a podcast from an Internet Radio source and then switch to Deezer and play a track from a playlist, clicking Next causes the previously played Internet Radio podcast to start playing instead of the next Deezer track.
